# GOOD ENVIRONMENTAL MANAGEMENT PRACTICES FOR THE INDUSTRIAL GAS INDUSTRY

As part of a programme of harmonization of industry standards, the Asia Industrial Gases Association (AIGA) has issued publication 006, *Good Environment Management Practices for Industrial Gases Industry*, jointly produced by members of the International Harmonisation Council and originally published by the European Industrial Gases Association (EIGA) as IGC Doc 88, *Good Environment Management Practices for Industrial Gases Industry*.

This publication is intended as an international harmonized publication for the worldwide use and application by all members of the Asia Industrial Gases Association (AIGA), Compressed Gas Association (CGA), EIGA, and Japan Industrial and Medical Gases Association (JIMGA). Each association's technical content is identical, except for regional regulatory requirements and minor changes in formatting and spelling.

#### Disclaimer

All technical publications of AIGA or under AIGA's name, including Codes of practice, Safety procedures and any other technical information contained in such publications were obtained from sources believed to be reliable and are based on technical information and experience currently available from members of AIGA and others at the date of their issuance.

While AIGA recommends reference to or use of its publications by its members, such reference to or use of AIGA's publications by its members or third parties are purely voluntary and not binding.

Therefore, AIGA or its members make no guarantee of the results and assume no liability or responsibility in connection with the reference to or use of information or suggestions contained in AIGA's publications.

AIGA has no control whatsoever as regards, performance or non performance, misinterpretation, proper or improper use of any information or suggestions contained in AIGA's publications by any person or entity (including AIGA members) and AIGA expressly disclaims any liability in connection thereto.

AIGA's publications are subject to periodic review and users are cautioned to obtain the latest edition

Note: Technical changes from the previous edition are underlined

#### 1 Introduction

This document is a practical guide to good environmental management practices in the industrial gases industry and has been developed in conjunction with the European Industrial Gases Association who publishes this guidance as EIGA Doc 88 [1] <sup>1</sup>. It can be used on its own or in conjunction with other AIGA publications on environmental management.

The environmental management system standard ISO 14001 *Environmental Management Systems – Requirements with guidance for use* [2] requires organisations to review their environmental aspects and put in place practices to minimise and control their impacts. This document provides a standardised list that can be used in any industrial gas company.

# 2 Scope and purpose

# 2.1 Scope

This document provides guidance on good environmental management practices to industrial gas facility managers. It does not give specific advice on health and safety issues, however consideration shall always be given to these issues when conducting operational risk assessments before undertaking any activity.

Industrial gas facilities have distinct activities and associated environmental aspects that can impact the environment. This publication provides good environmental practices at air separation and helium production facilities, hydrogen and carbon monoxide facilities, and carbon dioxide facilities. It also provides good environmental practices for truck maintenance and distribution, acetylene and nitrous oxide manufacturing, cylinder fill operations, specialty gases operations and customer installation (bulk tanks) activities.

# 2.2 Purpose

<u>This publication identifies</u> typical industrial gas industry activities and associated environmental aspects that can have a negative impact on the environment and identifies corresponding practices that can minimize or eliminate those impacts.

Environmental aspects can include <u>solid/hazardous waste</u>, <u>air emissions</u>, <u>waste water discharges</u>, storm water discharges, noise, and releases generated at various industrial gas facilities.

For each activity, environmental aspects, potential environmental impacts, and good environmental management practices (GEMP) have been identified that can be used to prevent pollution, minimize the generation of wastes, discharges and releases, manage any residuals and use of energy, raw materials, water and land.

# 3 Definitions

For the purpose of this publication, the following definitions apply.

#### 3.1 Publication terminology

#### 3.1.1 Shall

Indicates that the procedure is mandatory. It is used wherever the criterion for conformance to specific recommendations allows no deviation.

#### 3.1.2 Should

Indicates that a procedure is recommended.

<sup>&</sup>lt;sup>1</sup> References are shown in bracketed numbers and are listed in order of appearance in the reference section

#### 3.1.3 Will

Is used only to indicate the future, not a degree of requirement.

# 3.1.4 May

Indicates that the procedure is optional.

#### 3.1.5 Can

Indicates a possibility or ability.

#### 3.2 Environmental aspect

Element of an organization's activities, products or services that can interact with the environment.

#### 3.3 Environmental impact

Any change to the environment, whether adverse or beneficial, wholly or partially resulting from an organization's activities, products or services.

### 3.4 Good environmental management practices (GEMP)

Suggested practices that can be used to minimize or eliminate potential environmental impacts.

# 4 Implementing good environmental management practices

Companies should periodically and systematically review processes and operating practices to identify waste, <u>emissions</u>, discharges, and release reduction opportunities, and to optimise the use of resources.

Conducting an inventory assists in targeting pollution prevention opportunities. When conducting an inventory, the following information should be gathered for each waste, <u>emission</u>, discharge or release to assist in prioritising opportunities:

- Source of each major waste, emission, discharge or release;
- Rates of generation;
- Toxicity or hazard characteristics; and
- Disposal method and costs.

When implementing GEMP, preference should be given to the following waste minimization hierarchy:

- Reduce at source (most preferred);
- Reuse or recycle;
- Treatment and/or energy recovery; and
- Disposal (least preferred).

Objectives and targets for improvement should then be set for the priority items, and these targets should be monitored, measured and reviewed on a regular basis.

When practical, companies should systematically identify and implement GEMP applicable to their operations. Where laws and regulations have requirements more stringent than those found in this publication, they should be followed.

Site Managers should promote employee awareness and conduct training of GEMP that apply to their site. Periodic feedback and suggestions should be solicited from employees on ways to minimize wastes, <u>emissions</u>, discharges and releases. Employees should be recognized for significant ideas that improve environmental performance and reduce the generation of wastes, <u>emissions</u>, discharges and releases.

# 5 How to use the appendices

The appendices identify GEMP applicable to pollution prevention opportunities at the following types of facilities, processes and operations.

Not every facility or operation has every source, waste, <u>emission</u>, discharge or release listed in each applicable appendix. Site Managers should use the appendices as a library to identify those sources of potential pollution that do apply to their facility and then implement the recommended, applicable GEMP to the extent practical.

Appendix A lists non-process-specific sources of wastes, <u>emission</u>, discharges and releases common to many industrial gas facilities. One or more of the remaining Appendices can apply depending on the specific processes at the site.

- Appendix A GEMP for all facilities
- Appendix B GEMP for air separation units (ASU) and helium production facilities
- Appendix C GEMP for hydrogen/carbon monoxide (HyCO) units
- Appendix D GEMP for carbon dioxide production and dry ice facilities
- Appendix E GEMP for truck maintenance and distribution terminals
- Appendix F GEMP for acetylene manufacturing operations
- Appendix G GEMP for cylinder fill and cylinder maintenance operations (including specialty gas operations)
- Appendix H GEMP for customer installations
- Appendix I GEMP for nitrous oxide <u>manufacturing</u> plants

| Building, floor drains   | Solvents, oils, detergents, chemicals               | Soil<br>Groundwater   | Keep solvents, oils, and other hazardous materials out of floor drains through proper storage and handling.  |  |  |
|  |   |                       | Use floor drain plugs in areas of high spill potential or seal drains that are not needed.   |  |  |
|  |   |                       | Maintain an adequate supply of spill kits in areas of high spill potential.  |  |  |
|  |   |                       | Avoid hosing down areas. Use dry clean-up techniques.  |  |  |
| Building and insulation materials                              | Asbestos  | Air<br>Waste disposal | Notify the appropriate agency in advance, as required, of any asbestos demolition or renovation.   |  |  |
|  |   |                       | Use only qualified asbestos removal contractors when removing or repairing asbestos.   |  |  |
|  |   |                       | Contractors shall remove asbestos materials according to regulatory requirements. Place waste in double-lined plastic bags or in drums with proper labels. Wet down asbestos during removal, handling, and disposal. |  |  |
|  |   |                       | Dispose of asbestos through an approved disposal contractor.   |  |  |

|  | APPENDIX A - GEMP for all facilities   |                                    |  |  |  |  |
|--|--|------------------------------------|--|--|--|--|
| Activity/Source                            | Environmental<br>Aspect  | Potential Impact(s)                | Good Environmental Management Practices  |  |  |  |
| Chemical and waste loading/unloading areas | Fuel and fuel additives, heating oil, acetone, lubricating oils, solvents, bleach, sulphuric acid, biocides, ethylene glycol, propylene glycol, water treatment corrosion inhibitors, caustics, used oil, and similar chemical or waste-like materials | Soil Surface water Groundwater Air | Avoid positioning transport vehicles near or over storm drains.  Attend loading/unloading activities where safe and practical.  Have spill kits, absorbent booms, sewer block mats readily available.  Check integrity of transfer hoses, fittings, and connections.  Ensure the correct fill lines and containers/tanks are identified before loading/ unloading.  Illuminate unloading areas if material transfer occurs at night.  Use drip pans and buckets to catch small leaks from transfer hoses and fittings.  Prevent overfilling of storage tanks during deliveries through procedural or engineering controls.  Report and clean up any spills or leaks immediately.  Develop and implement a site emergency/spill plan. |  |  |  |

AIGA 006/15

|                                    | APPENDIX A - GEMP for all facilities  |                                |   |  |  |
|------------------------------------|---|--------------------------------|---|--|--|
| Activity/Source                    | Environmental<br>Aspect   | Potential Impact(s)            | Good Environmental Management Practices   |  |  |
| Chemical and waste storage areas   | Fuel and fuel additives, heating oil, acetone,                                  | Soil Surface water Groundwater | Store liquid chemicals in proper containers, preferably on an impervious surface with secondary containment.  |  |  |
|                                    | lubricating oils,<br>solvents, bleach,<br>sulphuric acid,<br>biocides, ethylene | Air                            | Periodically check container integrity for signs of deterioration or damage. Document if required.  |  |  |
|                                    | glycol, propylene<br>glycol, water  |                                | Periodically check containment areas for leaks. Document if required.   |  |  |
|                                    | treatment<br>corrosion<br>inhibitors, used                                      |                                | Keep containment valves closed except to drain uncontaminated rainwater.  |  |  |
|                                    | oil, and similar<br>chemical or<br>waste-like<br>materials                      |                                | Keep containers closed when not in use. Prevent exposure to rainfall, use drum rain caps for drums stored outside. Store outdoor containers off the ground (e.g., on pallets) to prevent bottom corrosion, possible leakage, and assist in visual inspection. |  |  |
|                                    |   |                                | Minimize and consolidate chemical inventories. Do not buy larger quantities than needed simply to get a lower price. Disposal costs will often exceed savings.  |  |  |
|                                    |   |                                | Use existing chemical inventories before switching to another supplier.   |  |  |
|                                    |   |                                | Redistribute excess chemicals for use at another facility.  |  |  |
|                                    |   |                                | Place drip pans beneath drum dispensing valves.   |  |  |
|                                    |   |                                | Report and clean up any spills or leaks immediately.  |  |  |
|                                    |   |                                | Prevent overfilling of storage tanks during deliveries through procedural or engineering controls.  |  |  |
|                                    |   |                                | Develop and implement a site emergency/spill plan.  |  |  |
|                                    |   |                                | Designate separate areas for waste storage and chemical storage.  |  |  |
|                                    |   |                                | Ensure that all chemical and waste containers have proper labels.   |  |  |
|                                    |   |                                | Do not mix hazardous and non-hazardous wastes.  |  |  |
|                                    |   |                                | Post signs for designated hazardous waste storage areas.  |  |  |
| Demolition and construction debris | Concrete, asphalt, metal,   | Waste disposal                 | Identify and remove any asbestos materials before demolition.   |  |  |
|                                    | miscellaneous   |                                | Recycle concrete, asphalt, and scrap metal where outlets are available.   |  |  |
|                                    |   |                                | Dispose of through an approved disposal contractor.   |  |  |
|                                    |   |                                | Reuse surplus soil to landscape site if feasible and acceptable.  |  |  |

| APPENDIX A - GEMP for all facilities |  |  |   |  |
|--------------------------------------|--|--|---|--|
| Activity/Source                      | Environmental<br>Aspect  | Potential Impact(s)                    | Good Environmental Management Practices   |  |
| Drums (empty)                        | Recyclable<br>materials  | Use of natural resource Waste disposal | Purchase chemicals in bulk form or use recyclable/ returnable containers, where practical.  Remove chemical residuals to the extent possible.  Return empty drums to original supplier or recycle through an approved drum reconditioner.   |  |
| Equipment and parts cleaning         | Solvents and detergents  | Soil Surface water Groundwater Air     | Advice on cleaning for oxygen service can be found in CGA G-4.1, Cleaning Equipment for Oxygen Service, and EIGA Doc 33, Cleaning equipment for oxygen service [3,4]. <sup>2</sup> Minimize solvent/chemical purchases and use. Do not buy and use more than needed. Ensure that all solvent chemical containers have proper labels. Keep containers and parts cleaners closed when not in use. Use drip pans to collect solvents. Collect spent solvents for recycling or disposal through a licensed vendor. Do not pour solvents down any drains or on the ground. |  |
|                                      |  |  | Do not mix spent solvents with used oil or other chemicals.  Report and clean up any spills immediately and follow emergency procedures.  Determine if spent detergents can be discharged to sanitary sewer.  |  |
| Fluorescent light fixtures           | Mercury,<br>polychlorinated<br>biphenyls (PCB)<br>ballast <u>in older</u><br><u>fixtures</u> | Waste disposal                         | Recycle/dispose lamps and ballast via approved recycling/disposal contractor.  Pack suitable for transport to prevent breakage when transporting for recycle/disposal (e.g., Keep original packaging)  Replace with energy efficient and mercury-free or low-mercury lamps.   |  |

| Fuelling island / station            | Diesel fuel,<br>gasoline, <u>and</u> | Soil<br>Surface water    | Check fuel dispenser sump routinely for leaks and product/water accumulation.   |  |  |
|                                      | <u>additives</u>                     | Groundwater              | Maintain adequate supply of spill absorbent at fuelling station.  |  |  |
|                                      |                                      | Air                      | Where present, periodically check oil/water separator.  |  |  |
|                                      |                                      |                          | Check housekeeping. Remove any oilstained gravel.   |  |  |
|                                      |                                      |                          | Avoid topping off vehicle fuel tanks.   |  |  |
|                                      |                                      |                          | Avoid unattended filling of vehicles.   |  |  |
|                                      |                                      |                          | Avoid hosing down area. Use dry clean-up techniques.  |  |  |
|                                      |                                      |                          | Minimize rain/storm water run-on into fuel island area.   |  |  |
|                                      |                                      |                          | Install canopy, where practical, to keep rainfall off fuelling island.  |  |  |
|                                      |                                      |                          | Report and clean-up spills immediately.   |  |  |
| Halon fire suppression systems       | Halon                                | Depletion of ozone layer | Maintain system to avoid leaks. As suitable halon replacements are identified, recover halon and place in halon banks.            |  |  |
|                                      |                                      |                          | New systems shall be designed without halon.  |  |  |
| Mercury switches and                 | Mercury                              | Waste disposal           | Recycle or dispose by approved contractor.  |  |  |
| other mercury-<br>containing devices |                                      |                          | Have mercury spill kits available.  |  |  |
| Oil contaminated soil/debris         | Oily rags,<br>leak/spill clean-up    | Soil<br>Surface water    | Dispose of through an approved disposal contractor.   |  |  |
|                                      | materials, oily soils                | Waste disposal           | Recycle through an approved asphalt batching or other appropriate recycling facility plant when available.                        |  |  |
|                                      |                                      |                          | Clean up oil stained soil/gravel promptly.  |  |  |
| Oil/water separators                 | Oil, oily water, oily sludge         | Surface water<br>Soil    | Minimize solids from going into drains routed to an oil/water separator.  |  |  |
|                                      | -                                    | Groundwater              | Periodically clean out separator to maintain optimum oil removal efficiency.  |  |  |
|                                      |                                      |                          | Routinely remove accumulated oil and sludge and recycle through an approved oil recycler. Test sludge for hazardous constituents. |  |  |
|                                      |                                      |                          | Do not mix solvents or other chemicals with used oil.   |  |  |
|                                      |                                      |                          | Periodically inspect integrity of separator.  |  |  |

|  | APPENDIX A - GEMP for all facilities                |   |  |  |
|--|---|---|--|--|
| Activity/Source  | Environmental<br>Aspect                             | Potential Impact(s)   | Good Environmental Management Practices  |  |
| Painting of buildings and equipment  | Paint residue, solvents, abrasive blasting material | Air<br>Soil<br>Surface water<br>Groundwater<br>Waste disposal                     | Use water-based and low VOC paints to the extent possible.  Analyze old paint before removal to determine if toxic metals such as lead, chromium, or cadmium hazard exist.  Collect abrasive-blasted wastes. At the end of each day, secure wastes in appropriate containers.  Monitor paint contractor's operations, including material storage areas, and have contractor provide temporary spill containment around portable equipment containing diesel or gasoline.  Dispose of paint chips, abrasive blasting material, and associated painting supplies (e.g., tarps, brushes, rollers, rags, empty paint cans) as solid or hazardous wastes (depending upon analytical results) using an approved disposal contractor. All residual paint should be dry before disposal.  Use brush or roll-on paints instead of aerosol paints, where practical.  Dispose of all solvent-based paints and thinners through an approved disposal contractor. |  |
| Power supply, transformers, and capacitors  Product venting, compressors, traffic, | Mineral oil, PCB oil Sulfur hexafluoride            | Soil Surface water Groundwater Waste disposal Greenhouse gas emissions  Community | Periodically check equipment for leaks. Schedule periodic maintenance of equipment.  Report and clean up any leaks immediately.  Replace or retrofill PCB transformers or PCB capacitors.  Always test equipment for presence of PCBs before disposing of oils or equipment. Never assume there are no PCBs.  Arrange for disposal of mineral oils or PCBs through an approved disposal contractor.  Design and install compressors, expanders, and other equipment in accordance with   |  |
| etc.   |   |   | local noise requirements.  Use appropriate noise-attenuation measures as required (e.g., sound insulation, noise curtains, buildings, walls).  Select sites with adequate land and distance to buffer noise.  Site equipment in a location that will minimize the noise impact to neighbours.  Minimize night-time noise-generating activities.  Refer to EIGA Doc 85, Noise management for the industrial gases industry [5].   |  |

|  | APPENDIX A - GEMP for all facilities                        |                                      |  |  |  |
|--|---|--------------------------------------|--|--|--|
| Activity/Source                                    | Environmental<br>Aspect                                     | Potential Impact(s)                  | Good Environmental Management Practices  |  |  |
| Sanitary waste (foul) systems                      | Sewage  | Surface water<br>Soil                | Do not dispose of chemicals down sinks, drains, or toilets.  |  |  |
|  |   | Groundwater                          | Dispose of sanitary wastes through permitted municipal sanitary sewer, septic <u>system</u> , or onsite treatment.   |  |  |
|  |   |                                      | When on-site treatment is used, conduct appropriate preventive maintenance and testing. Keep operator certifications current, where required.                |  |  |
| Scrap metal,                                       | Recyclable  | Natural resource                     | Purge any gases from scrap cylinders.  |  |  |
| including cylinder valves, cylinders               | materials   | Waste disposal                       | Remove any fluids contained in equipment.  |  |  |
| (except acetylene cylinders), used equipment, etc. |   |                                      | Check any coatings or insulation on the equipment for asbestos and if present remove before scrapping equipment.   |  |  |
|  |   |                                      | Recycle through scrap metal dealer.  |  |  |
|  |   |                                      | Refer to CGA P-22, The Responsible  Management and Disposition of Compressed  Gases and their Cylinders.[6]  |  |  |
| Storage tanks–<br>aboveground (ASTs)               | Heating oil, diesel fuel, acetone,                          | sel Soil<br>Groundwater              | Provide secondary containment for tank and fill port.  |  |  |
|  | used oil, gasoline <u>.</u><br>etc.                         | Surface water                        | Provide overfill protection.   |  |  |
|  | Cito.   | Air                                  | Obtain regulatory approvals.   |  |  |
|  |   |                                      | Install barriers to protect tank from vehicular traffic.   |  |  |
|  |   |                                      | Periodically inspect the tank system.  |  |  |
|  |   |                                      | Provide spill kit near tank.   |  |  |
|  |   |                                      | Prepare emergency plan to handle accidental discharges.  |  |  |
| Storage tanks-<br>underground (USTs)               | Heating oil, diesel fuel, acetone, used oil, gasoline, etc. | Soil<br>Groundwater<br>Surface water | Install double-walled tanks and lines with release detection systems, spill collars, overfill protection, and cathodic protection for steel tanks and lines. |  |  |
|  |   | Air                                  | Conduct and document monthly release detection monitoring specified for the site's UST system.   |  |  |
|  |   |                                      | Periodically inspect spill collar/fill port.   |  |  |
|  |   |                                      | Periodically check spill/overfill devices.   |  |  |
|  |   |                                      | Conduct regular inspection of tank and line release detection system using a qualified contractor to ensure proper operation.                                |  |  |
|  |   |                                      | Periodically inspect cathodic protection systems using a qualified contractor.   |  |  |
|  |   |                                      | Report suspected leaks immediately.  |  |  |
|  |   |                                      | Report and clean up any spills immediately.  Avoid unattended filling of storage tank.   |  |  |
|  |   |                                      | Avoid unattended lilling of storage tank.  |  |  |

|                                       | APPENDIX A - GEMP for all facilities  |   |   |  |  |
|---------------------------------------|---|---|---|--|--|
| Activity/Source                       | Environmental<br>Aspect   | Potential Impact(s)                             | Good Environmental Management Practices   |  |  |
| Transportation–<br>employees          | Noise, exhaust fumes, fuel consumption  | Air Global warming Community                    | Set up company transport plans to minimize the need to travel.  Use e-mail, voice mail, and videoconferencing.  Use car pooling/sharing, public transport.  Provide training for vehicle drivers.   |  |  |
| Transportation—product                | Fuel, oil, grease,<br>antifreeze,<br>product, fuel<br>additives,<br>emissions and<br>spills | Air<br>Water<br>Noise<br>Land use<br>Energy use | Consider best supply option (e.g., on-site production).  Minimize transportation distances.  Purchase and maintain vehicles to be fuel efficient and minimize air emissions.  Avoid truck routes through residential neighbourhoods and minimize night-time transport through residential neighbourhoods.  Carry spill kits on vehicles and have an emergency response plan in place. |  |  |
| Trash (plant non-<br>hazardous waste) | Waste, recyclable materials   | Use of natural resource Waste disposal          | Segregate and recycle materials to the extent feasible (e.g., waste paper, aluminium cans, cardboard, wood pallets, packing materials).  Dispose of waste through an approved disposal contractor.  |  |  |

| Appendix B-                     | Appendix B—GEMP for air separation units and helium production facilities |  |   |  |
|---------------------------------|---|--|---|--|
| Source                          | Environmental<br>Aspect   | Potential Impact(s)                                    | Good Environmental Management Practices   |  |
| Argon production                | Ammonia (if ammonia dissociation method used)                             | Air emission   | Regular maintenance to minimize emissions. Switch to hydrogen supply, where practical.  |  |
| Cold box insulation             | Rock wool, perlite, vermiculite   | Waste disposal<br>Energy efficiency                    | Check for ice spots.  Replace insulation on shutdown.  Reuse perlite and vermiculite as a soil conditioner, where allowed.  Recycle, where possible.  Dispose of as solid waste through an approved disposal contractor.  |  |
| Compressors and vacuum pumps    | Lubricating oil   | Soil<br>Surface water<br>Waste Disposal<br>Groundwater | Minimize leaks through preventive maintenance.  Where present, keep foundation curbing and drains free of debris for effective drainage to oil/water separator.  Use absorbents to minimize oil seepage off foundations that are not tied to an oil/water separator.  Where practical, install roof over compressors to prevent contaminated storm water.  Recycle used oil and, where possible, saturated absorbents through an approved oil recycler.  Do not mix solvents or other chemicals with used oil.  Used oil contaminated with refrigerants or solvents requires special disposal.  Return empty drums to original supplier or recycle through an approved drum reconditioner, where practical. |  |
| Compressor—condensate           | Low pH (acidic),<br>copper, nickel,<br>lead                               | Surface water<br>Groundwater                           | Do not discharge onto the ground.  Discharge through a permitted outfall or sewer connection.  Reuse as makeup to cooling tower, where feasible.  Treat any excessive levels of metals.  Neutralize low pH before discharging.  |  |
| Compressor- vents               | Lubricating oil mists   | Air<br>Soil<br>Surface water                           | Install oil demisters to collect oil mist emissions.  Recycle the collected oil through an approved oil recycler.   |  |
| Cooler system-<br>chemical wash | Acids, metals, solids, chelants   | Surface water<br>Waste disposal                        | Dispose of spent chemical cleaning solutions through an approved disposal contractor.   |  |

| Appendix B-   | -GEMP for air s  | separation units a                                     | nd helium production facilities   |
|---|--|--|---|
| Source  | Environmental<br>Aspect  | Potential Impact(s)                                    | Good Environmental Management Practices   |
| Cooling systems—<br>closed loop                                       | Ethylene glycol,<br>propylene glycol,<br>and similar heat<br>exchange fluids                   | Soil<br>Surface water<br>Waste disposal<br>Groundwater | Minimize leaks through preventive maintenance.  Maintain proper level of corrosion inhibitors to extend life of solutions.  Recycle glycols by approved recycler.  Dispose of spent solutions through an approved disposal contractor.  |
| Cooling tower–<br>blowdown  | Biocides, acids, corrosion inhibitors  | Surface water Natural resource                         | Discharge through a permitted outfall or sewer connection.  Avoid use of chromate-based or zinc-based corrosion inhibitors.  Avoid excessive chemical feed through tight control of water chemistry.  Run cooling tower at optimum concentration cycles to minimize chemical loss, wastewater discharges, and makeup water consumption.  Purchase water treatment chemicals in bulk or returnable containers instead of drums, where practical.  Return empty drums to original supplier or recycle through an approved drum reconditioner, where practical.  Use of existing supplier of chemicals and obtain any necessary permit modifications before switching chemicals. |
| Cooling tower–mists   | Legionella risk  | Legionella   | Planned maintenance and disinfection of cooling systems.  Regular testing of systems for Legionella.  |
| Cooling tower—<br>sidestream filter<br>backwash                       | Solids   | Surface water  | Treat if required before discharge through a permitted outfall or sewer connection.   |
| Cooling tower—<br>sludge  | Solids, heavy<br>metals (chromium,<br>copper, zinc)  | Waste disposal   | Test for presence of heavy metals to determine if a hazardous waste.  Dispose of through an approved disposal contractor.   |
| Electricity   | Indirect   | Energy use Air Water Solid waste                       | Design, purchase, and maintain equipment to operate efficiently and minimize energy use.  Conduct energy audits to identify potential opportunities to improve energy efficiency.  Train employees to conserve energy.  |
| Fuel-fired<br>vaporizers and<br>temperature swing<br>adsorption units | Particulate matter,<br>carbon monoxide,<br>hydrocarbons,<br>nitrogen oxides,<br>sulfur dioxide | Air<br>Energy  | Operate in accordance with air permit, where applicable. Operate and maintain equipment to be efficient. Use fuel with low sulfur and solids content.   |

| Appendix B-                       | -GEMP for air s  | separation units a                       | nd helium production facilities  |

| Source   | Environmental<br>Aspect                           | Potential Impact(s)     | Good Environmental Management Practices  |
| Truck emissions  | Carbon monoxide,                                  | Air                     | Optimize route scheduling and routes.  |
| (fuel economy)   | nitrogen oxides,<br>hydrocarbons,<br>particulates | Energy                  | Maintain vehicles to operate efficiently while minimizing emissions.   |
|  | (diesel)  |                         | Minimize trips and distances traveled to extent possible by maximizing load volume going out and minimizing load volume returned.                      |
|  |   |                         | Purchase energy-efficient vehicles that meet regulatory emission standards.  |
|  |   |                         | Use low sulfur fuel and particle traps where feasible.   |
|  |   |                         | Use different fuels (e.g., LNG, hydrogen, CNG).  |
|  |   |                         | Measure and monitor fuel consumption and set targets.  |
| Truck batteries  | Lead, sulphuric acid                              | Soil Waste disposal     | Return used batteries to dealer when purchasing new batteries.   |
|  |   |                         | Protect batteries from severe cold to prevent freezing and release of battery acid. Store batteries indoors on impervious surfaces, whenever possible. |
|  |   |                         | Store batteries on wooden pallets (one battery high).  |
|  |   |                         | Do not throw batteries in normal waste (trash) container.  |
|  |   |                         | Do not try to break open and reclaim lead from batteries on site.  |
| Truck tires  | Tires   | Waste disposal Fuel use | Recycle used tires back to dealer when purchasing new tires.   |
|  |   |                         | Use retreaded tires, where appropriate.  |
|  |   |                         | Maintain proper tire inflation.  |
| Truck breakdowns and accidents                                   | Diesel fuel,<br>antifreeze, motor                 | Soil<br>Surface water   | Where appropriate, keep spill kits stocked on each truck.  |
| 0  | oil, hydraulic oil                                | Waste disposal          | Report and clean up spills immediately.  |
|  |   |                         | Take clean-up debris from small incidents back to home terminal for disposal.  |
|  |   |                         | Use clean-up contractor for larger spills. Contact an environmental representative for assistance.   |

| APPENDIX E—GEMP for truck maintenance and distribution terminals |  |   |  |  |
|--|--|---|--|--|
| Source   | Environmental<br>Aspect  | Potential Impact(s)   | Good Environmental Management Practices  |  |
| Vehicle washing  | icle washing Oils, greases, detergents, suspended solids, salts, sludge residual | detergents,<br>suspended solids,<br>salts, sludge<br>residual | Wash vehicles in wash bays or other designated areas.  |  |
|  |  |   | Discharge through a permitted outfall or sewer connection. Discharging to a storm water drain is prohibited.   |  |
|  |  |   | Remove accumulated solids/sludge from wash bay sump or grit chamber regularly.   |  |
|  |  |   | Wash bay areas that do not have a solid collection sump. Use a fabric drain-filtering device to prevent accumulated solids/sludge from wash bay from entering and accumulating in oil/water separator. |  |
|  |  |   | Use only nonphosphate, nonemulsifying detergents, and quick oil release detergents.  |  |
|  |  |   | Treat wash water through an oil/water separator before discharge.  |  |

| APPENDIX F—GEMP for acetylene manufacturing operations |   |  |   |
|--|---|--|---|
| Source   | Environmental<br>Aspect   | Potential Impact(s)                                    | Good Environmental Management Practices   |
| Acetylene generator                                    | Carbide metal and carbon  | Waste disposal   | Minimize impurities in purchased carbide. Clean generator regularly. Dispose of residuals to an authorized contractor as nonhazardous waste.  |
| Acetylene generator and lime pit area                  | Calcium hydroxide<br>(lime)<br>scale/deposits,<br>acid wash water<br>used to remove<br>lime scale buildup | Waste disposal Soil                                    | Dispose of through an approved disposal contractor.  Collect acid wash water and reuse as a first rinse wash water the next time acid washing is needed.  Combine with lime slurry where possible.  Neutralize with lime before discharge.  Periodically check integrity of lime pit.   |
| Carbide lime slurry                                    | Calcium hydroxide<br>(lime) solids,<br>water  | Surface water<br>Soil<br>Waste disposal                | Decant water from solids.  Reuse decanted wastewater back in acetylene manufacturing process.  Reuse co-product lime as raw material for offsite wastewater treatment, agricultural/soil amendment, etc.  Refer to CGA G-1.5, Carbide Lime: Its Value and Uses [7] and EIGA Doc 143 Guide to lime applications [8].   |
| Compressors and vacuum pumps                           | Lubricating oil   | Soil<br>Surface water<br>Waste disposal<br>Groundwater | Minimize leaks through preventive maintenance.  Where present, keep foundation curbing and drains free of debris for effective drainage to oil/water separator.  Use absorbents to minimize oil seepage off foundations that are not tied to an oil/water separator.  Where practical, install roof over compressors to prevent contaminated storm water.  Recycle used oil, and where possible, saturated absorbents through an approved oil recycler.  Do not mix solvents or other chemicals with used oil.  Used oil contaminated with refrigerants or solvents requires special disposal.  Return empty drums to original supplier or recycle through an approved drum reconditioner, where practical.  Report and clean up any leaks immediately. |
| Compressor—condensate                                  | Low pH (acidic),<br>copper, nickel,<br>lead   | Surface water<br>Groundwater                           | Do not discharge onto the ground.  Discharge through a permitted outfall or sewer connection.  Reuse as makeup to cooling tower, where feasible.  Treat any excessive levels of metals.  Neutralize low pH before discharging.  |

| Appendix G—GEMP or cylinder fill and cylinder maintenance operations (including speciality gas operations) |                                     |  |   |
|--|-------------------------------------|--|---|
| Source   | Environmental<br>Aspect             | Potential Impact(s)                                    | Good Environmental Management Practices   |
| Compressors and vacuum pumps   | Compressors and Lubricating oil     | Soil<br>Surface water<br>Waste disposal<br>Groundwater | Minimize leaks through preventive maintenance.  |
|  |                                     |  | Where present, keep foundation curbing and drains free of debris for effective drainage to oil/water separator.                       |
|  |                                     |  | Use absorbents to minimize oil seepage off foundations that are not tied to an oil/water separator.                                   |
|  |                                     |  | Where practical, install roof over compressors to prevent contaminated storm water.   |
|  |                                     |  | Recycle used oil, and where possible, saturated absorbents through an approved oil recycler.  |
|  |                                     |  | Do not mix solvents or other chemicals with used oil.   |
|  |                                     |  | Used oil contaminated with refrigerants or solvents requires special disposal.  |
|  |                                     |  | Return empty drums to original supplier or recycle through an approved drum reconditioner, where practical.                           |
|  |                                     |  | Report and clean up any leaks immediately   |
| Compressor–<br>condensate  | Low pH (acidic),<br>copper, nickel, | Surface water Groundwater                              | Do not discharge onto the ground.   |
| Condensate   | lead                                |  | Discharge through a permitted outfall or sewer connection.  |
|  |                                     |  | Reuse as makeup to cooling tower, where feasible.   |
|  |                                     |  | Treat any excessive levels of metals.   |
|  |                                     |  | Neutralize low pH before discharging.   |
| Compressor-vents   | Lubricating oil mists               | Air<br>Soil  | Install oil demisters to collect oil mist emissions.  |
|  |                                     | Surface water  | Recycle the collected oil through an approved oil recycler.   |
|  |                                     |  | Report and clean-up any leaks immediately   |
| Cylinders-filling  | Flammable/toxic gases               | Air<br>Odour nuisance                                  | Design and maintain filling equipment to minimize leaks.  |
|  |                                     |  | When filling flammable/toxic gases, provide continuous, periodic monitoring to ensure system integrity.                               |
|  |                                     |  | Properly train employees to safely conduct filling and follow filling procedures.   |
|  |                                     |  | Consider suitable treatment before releasing gases containing flammable or toxic materials, in some cases, an air permit is required. |

| Appendix G—GEMP or cylinder fill and cylinder maintenance operations (including speciality gas operations) |  |                                 |  |

| Cylinders-painting   | Paint, paint<br>thinners, paint<br>cans, aerosol<br>cans, paint rollers<br>and brushes,<br>VOC, paint booth<br>filters | Air<br>Waste disposal<br>Soil   | Use water-based paints or paint with low VOC content.  Discharge water-based paint rinsewater through a permitted sewer connection. Do not pour on ground or in storm sewer.  Install paint booth for high volume painting (an air permit may be required).  Use aerosol can-puncturing system to release propellant and drain liquid.  Do not throw liquids in trash dumpster. Allow empty paint cans, paintbrushes, and rollers to dry before disposing in waste/ trash.  Collect used paint, paint thinners for disposal via an approved disposal contractor. Do not mix with other wastes or pour on ground.  Operate in accordance with all rules and |
| Cylinders - venting/<br>purging  | Various inert,<br>atmospheric,<br>flammable, and<br>toxic gases  | Air<br>Odour nuisance           | regulations  Recover the product if technically and economically feasible.  Only vent cylinder gases allowed by air permit, air regulations, or air permit exemption.  Vent toxic and flammable gases to appropriate control devices.  Top fill cylinders whenever possible to minimize cylinder purging emissions.  Refer to P-22, The Responsible Management and Disposition of Compressed Gases and their Container, EIGA Doc 30, Disposal of gases; and EIGA Doc 85, Noise Management for the Industrial Gases Industry [6, 9, 5].   |
| Cylinders-<br>requalification  | Wastewater   | Surface water<br>Waste disposal | Recycle cylinder test water to the extent practical.  Discharge through a permitted outfall or sewer connection.  Remove and dispose of any residue containing metals or other contaminants.  Render rejected cylinders unusable and discard as scrap metal.   |
| Cylinders-surface preparation  | Abrasive blasting media, lead, chromium, cadmium, particulates, silica, paint chips                                    | Air<br>Waste disposal           | Conduct operations in accordance with air permit or air permit exemption.  Control particulate emissions through dust collector.  Test waste for metals (lead, chromium, cadmium) to determine if hazardous waste.  Dispose of waste through an approved disposal contractor.  |

| Cylinder preparation   | Plastic from<br>packaging, shrink<br>wrap,<br>polytetrafluoroethy<br>lene (PTFE) tape | Waste disposal   | Send for recycling or recovery.  Dispose of waste through an approved disposal contractor.  |
| Cylinders-<br>unserviceable  | Various inert,<br>atmospheric,<br>flammable, and<br>toxic gases                       | Air<br>Waste disposal  | Do not accept unknown cylinders and lecture bottles.  Keep problem cylinder inventories low by directing cylinders to appropriate locations for processing on an ongoing basis.  Atmospherics (argon, nitrogen, and oxygen) may be vented on site, but only after contacting the environmental expert to insure that local/state environmental regulations do not prohibit such venting.  Refer to CGA P-22 and EIGA Doc 30 [6, 10].  |
| Ion mobility<br>analyzers, helium<br>ionization detectors,<br>dewpointers                                  | Radioactive materials   | Waste disposal   | Return radioactive cells to manufacturer or approved disposal contractor.  Do not throw in normal nonhazardous waste containers.  Document all pending transfers of radioactive materials to and from the site to applicable regulatory agencies.  Perform wipe tests for leaks, where required.  Maintain all warning labels on analyzers.  Obtain appropriate regulatory approvals to own and use radioactive materials.  |
| Process<br>refrigeration—<br>Refrigerant systems   | Refrigerants<br>(CFCs, HCFCs<br>HFCs, PFCs,<br>ammonia)                               | Accidental release Fugitive release Ozone depletion Global warming Air | Monitor and document the rate of consumption of refrigerants to detect leaks.  Repair leaks promptly.  Do not vent refrigerants to atmosphere.  Evacuate refrigerants to prescribed levels before major maintenance and servicing using certified technicians and approved recovery and recycling equipment.  Reuse excess refrigerant inventories at other facilities or recycle through an approved recycling contractor.  Where practical, retrofit units with more environmentally friendly refrigerants. |
| Scrap metal  | Recyclable<br>materials   | Natural resource<br>Waste disposal                                     | Purge any gases from scrap tanks, etc. Remove any fluids contained in equipment. Check any coatings or insulation on the equipment for asbestos and if present remove before scrapping equipment. Recycle through scrap metal dealer. Operate and maintain in accordance with applicable rules and regulations. Report and clean-up any leaks immediately.  |
